

ABSTRACT

The present invention is directed to providing sensitive and accurate assays for genotyping with a minimum or absence of target-specific amplification.

1. A method for genotyping a sample, comprising:
2. amplifying a target sequence from the sample;
3. detecting the amplified target sequence;
4. determining the genotype of the sample based on the detected amplified target sequence;
5. wherein the amplified target sequence is a product of a target-specific amplification reaction.
